

## HOW TO CALIBRATE A THERMOMETER

- 1- Fill a pot at least 6" deep with water
- 2- Bring the water to a boil
- 3- Put the thermometer in the boiling water. Don't touch the bottom of the pot with the stem. The temperature reading will be off.
- 4- Verify the temperature
- 5- If you are not at 212<sup>0</sup>F or at 0<sup>0</sup>F for a maple syrup thermometer, adjust the screw at the back of the thermometer to get the right value.
